CableLabs® Content 3.0 Specification

MD-SP-CONTENTv3.0-C01-151104

CLOSED

Notice

This Metadata specification is the result of a cooperative effort undertaken at the direction of Cable Television Laboratories, Inc. for the benefit of the cable industry and its customers. You may download, copy, distribute, and reference the documents herein only for the purpose of developing products or services in accordance with such documents, and educational use. Except as granted by CableLabs in a separate written license agreement, no license is granted to modify the documents herein (except via the Engineering Change process), or to use, copy, modify or distribute the documents for any other purpose.

This document may contain references to other documents not owned or controlled by CableLabs. Use and understanding of this document may require access to such other documents. Designing, manufacturing, distributing, using, selling, or servicing products, or providing services, based on this document may require intellectual property licenses from third parties for technology referenced in this document. To the extent this document contains or refers to documents of third parties, you agree to abide by the terms of any licenses associated with such third-party documents, including open source licenses, if any.

DISCLAIMER

This document is furnished on an "AS IS" basis and neither CableLabs nor its members provides any representation or warranty, express or implied, regarding the accuracy, completeness, noninfringement, or fitness for a particular purpose of this document, or any document referenced herein. Any use or reliance on the information or opinion in this document is at the risk of the user, and CableLabs and its members shall not be liable for any damage or injury incurred by any person arising out of the completeness, accuracy, or utility of any information or opinion contained in the document.

CableLabs reserves the right to revise this document for any reason including, but not limited to, changes in laws, regulations, or standards promulgated by various entities, technology advances, or changes in equipment design, manufacturing techniques, or operating procedures described, or referred to, herein.

This document is not to be construed to suggest that any company modify or change any of its products or procedures, nor does this document represent a commitment by CableLabs or any of its members to purchase any product whether or not it meets the characteristics described in the document. Unless granted in a separate written agreement from CableLabs, nothing contained herein shall be construed to confer any license or right to any intellectual property. This document is not to be construed as an endorsement of any product or company or as the adoption or promulgation of any guidelines, standards, or recommendations.

Document Status Sheet

Document Control Number:	MD-SP-CONTENTv3.0-C01-151104			
Document Title:	CableLabs® Content 3.0 Specification			
Revision History:	I01 - Released 8/12/10 I02 - Released 12/10/12 C01 - Released 11/04/15			
Date:	November 4, 2015			
Status:	Work In Progress	Draft	Issued	Closed
Distribution Restrictions:	Author Only	CL/Member	CL/Member/ Vendor	Public

Key to Document Status Codes:

- Work in Progress** An incomplete document, designed to guide discussion and generate feedback that may include several alternative requirements for consideration.
- Draft** A document in specification format considered largely complete, but lacking review by Members and vendors. Drafts are susceptible to substantial change during the review process.
- Issued** A generally public document that has undergone Member and Technology Supplier review, cross-vendor interoperability, and is for Certification testing if applicable. Issued Specifications are subject to the Engineering Change Process.
- Closed** A static document, reviewed, tested, validated, and closed to further engineering change requests to the specification through CableLabs.

Trademarks:

CableLabs® is a registered trademark of Cable Television Laboratories, Inc. Other CableLabs marks are listed at <http://www.cablelabs.com/certqual/trademarks>. All other marks are the property of their respective owners.

This page left blank intentionally.

1 SCOPE

1.1 Introduction and Purpose

This document describes the grammar needed to represent information pertinent to the distribution, presentation and consumption of video-on-demand (VOD) content. In a normal use case, the VOD metadata originates from a provider and is distributed to operators.

A set of files referenced in this document contains the XML Schema definition that may be used to validate XML documents purported to conform to this specification. This specification and accompanying XML Schema documents are the Point of Authority for compliance.

1.2 Requirements

Throughout this document, the words that are used to define the significance of particular requirements are capitalized. These words are:

"MUST"	This word means that the item is an absolute requirement of this specification.
"MUST NOT"	This phrase means that the item is an absolute prohibition of this specification.
"SHOULD"	This word means that there may exist valid reasons in particular circumstances to ignore this item, but the full implications should be understood and the case carefully weighed before choosing a different course.
"SHOULD NOT"	This phrase means that there may exist valid reasons in particular circumstances when the listed behavior is acceptable or even useful, but the full implications should be understood and the case carefully weighed before implementing any behavior described with this label.
"MAY"	This word means that this item is truly optional. One vendor may choose to include the item because a particular marketplace requires it or because it enhances the product, for example; another vendor may omit the same item.

2 REFERENCES

2.1 Normative References

In order to claim compliance with this specification, it is necessary to conform to the following standards and other works as indicated, in addition to the other requirements of this specification. Notwithstanding, intellectual property rights may be required to use or implement such normative references.

3 TERMS AND DEFINITIONS

This specification uses the following terms:

Asset	A combination of content and other Assets along with their associated metadata. Assets may directly refer to physical media, in which case they are considered Content Assets. An Asset may be an abstract container of references to other Assets with metadata that applies to all of the referenced Assets.
Asset Distribution Interface	The means by which assets (content as well as metadata describing that content) are transported from a provider to an Asset Management System. In addition, it provides a mechanism by which ‘block’ updates may be made to previously distributed assets. These block updates include metadata replacement, adding a new child asset to a previously received asset and deleting an asset.
Asset Distribution System	Provides transportation of Assets from the premises of the Assets’ provider to the premises of the MSO. It interfaces to the Asset Management System using the Asset Distribution Interface (ADI).
Asset Management System	An entity that stores and manages the lifecycle of Assets.
Content Asset	A specific type of Asset including a reference to content, which is a physical media file (e.g., MPEG-encoded movie) along with the necessary metadata required to use the content for a given application.
Metadata	Descriptive data associated with a content asset or file. It may vary in depth from merely identifying the asset or information to populate an EPG to providing a complex index of different scenes in a movie or providing business rules detailing how the content may be displayed, copied or sold. Separate uses for metadata have originated from the studios, distribution networks (Cable, Satellite), down to the CPE (STBs, PVRs).
Provider	A Party responsible for allocating asset identifiers.

4 ABBREVIATIONS AND ACRONYMS

This specification uses the following abbreviations:

AMS	Asset Management System
APS	Analog Protection System
CA	Content Asset
CGMS_A	Copy Generation Management System - Analog
CIT	Constrained Image Trigger
EMI	Encryption Mode Indicator
EPG	Electronic Program Guide
HD	High Definition
ID	Identifier
MPAA	Motion Picture Association of America
MSO	Multiple System Operator
NPT	Normal Playback Time
PO	Placement Opportunity
SD	Standard Definition
STB	Set-Top Box
SVOD	Subscription Video-on-Demand
TBD	To Be Determined
TV	Television
UI	User Interface
URI	Uniform Resource Identifier
URL	Uniform Resource Locator
VOD	Video-on-Demand
XML	Extensible Markup Language

5 OVERVIEW

This specification defines the metadata content assets that are used to distribute a VOD release from a Provider to a number of cable operators.

5.1 Metadata 3.0 Data Model

The essential conceptual object in the Metadata 3.0 data model is an Asset. An asset represents the basic amount of information that all other metadata types SHOULD contain.

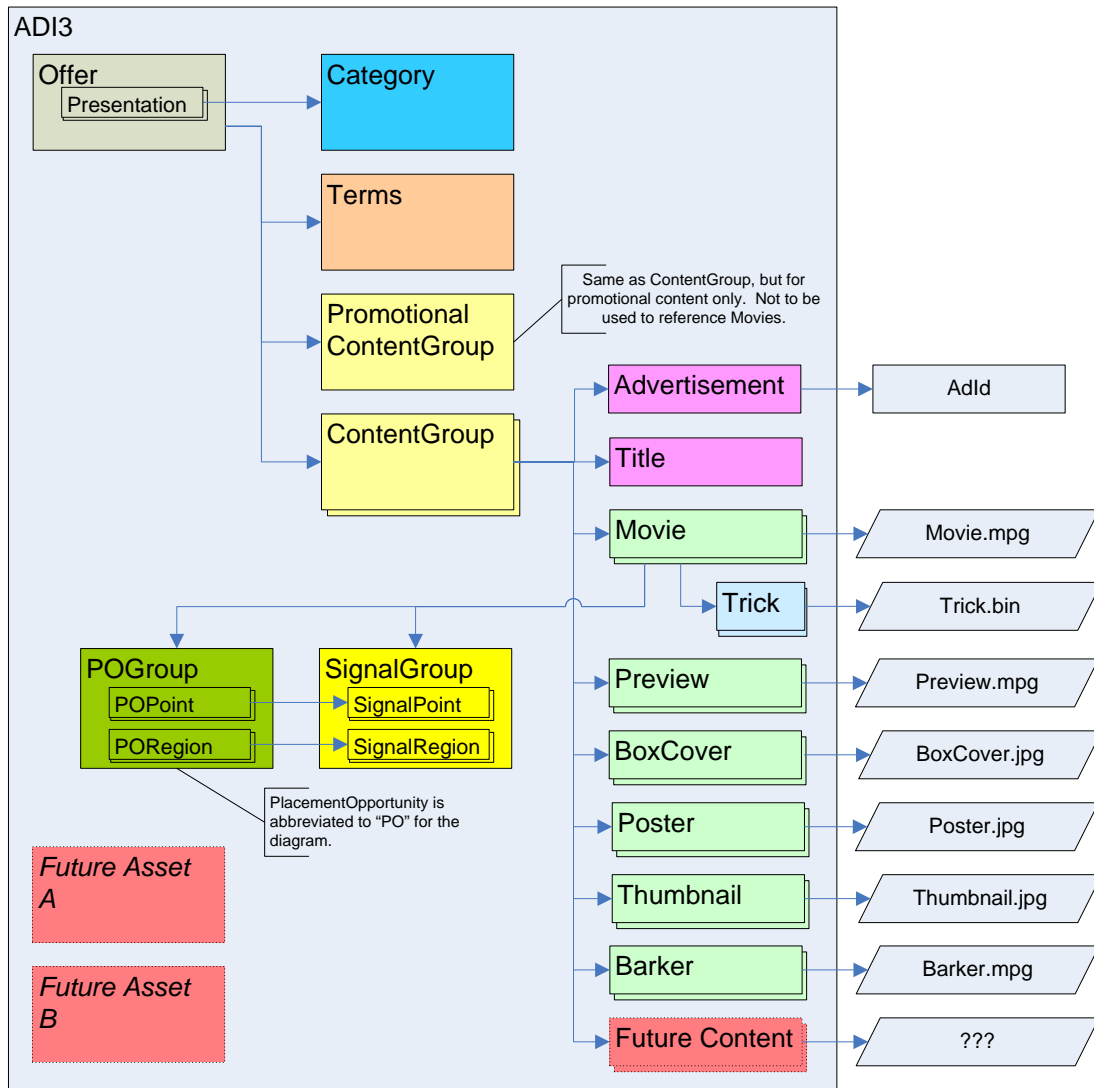

Figure 1 - Asset Relationships

5.1.1 Offer

An Offer is the structure used to assemble related content, title information, and terms for presentation to a customer. It will include all of the necessary information to sell content to a customer. This may include a single movie, a grouping of television programs, trilogies, or combinations of any sort. This model may be extended in the future to define offerings of mixed media.

An offer will include one or more content groups plus a single promotional content group. The promotional content group refers to content (title, previews, images, etc.) that may be used to present and sell the offer to a customer. Sometimes the promotional content for a combination (e.g., movie trilogy, TV season) will be different than for any single movie or program content group. In a simple case, the promotional content and included content will reference the same content group.

5.1.2 Terms

Pricing, content restrictions, and royalty information are bundled together to create a set of Terms. These terms represent the business agreements that accompany an offer and may be reused in more than one offer. The terms apply to all of the content included with the offer.

5.1.3 Category

A Category defines a set of category paths that are used for presentation in a VOD menu system.

5.1.4 ContentGroup

A ContentGroup is a combination of all of the related content (movies, previews, images, etc.) with its Title metadata. A Title is presumed to always be included and at least one form of content. Groupings of content may be reused by combining them with terms to create different offers.

A ContentGroup MAY contain multiple types of content or multiple versions of the same content. For example, a content group could contain metadata for both the standard and HD version of the same movie, if the two are interchangeable and can be represented by the same set of terms in the referencing offer.

5.1.5 Title

The Title defines the descriptive metadata for a movie or set of movies (or programs). This may be information that is used for actual display on the user's screen (e.g., Name of the movie, Actors), or may be used in the VOD system for classification or display constraints (e.g., Rating). Titles may be shared between different content groups, but only one title will be associated with a given content group.

5.1.6 ContentAsset

ContentAsset is the metadata asset that represents the actual content files distributed to the end system.

5.1.6.1 AudioVideo ContentAsset

This category of ContentAsset includes Movies, Previews, and Barkers. A Movie is the actual audio video content that's being offered to the user and is subject to the terms referenced in the offer. A Preview is an audio video promotion for the same movie, but is assumed to not be subject to the price expressed in the terms unless otherwise agreed. Note that a Movie can actually be any type of audio video content where the terms apply (e.g., TV program, pre-recorded event, etc.).

A Barker is a form of promotional content that is typically played in a continuous loop. It is usually not associated with a single Movie, but is provided in a separate content group for a particular category of content.

5.1.6.2 StillImage ContentAsset

The Still Image ContentAsset category includes Posters, BoxCovers, and Thumbnails that may be used to promote a Movie. It is often used as part of a user-selection screen in a VOD menu or EPG.

5.1.6.3 Trick ContentAsset

A Trick is a special type of ContentAsset that is associated with a Movie or Preview and includes pre-processed images to display during fast forward or rewind operations.

5.1.6.4 Extending the model with new ContentAssets

The ContentGroup may be extended to include new types of content that are not currently anticipated in this specification.

5.1.7 Advertisement

An Advertisement is a specialized form of a Title asset that includes a reference to the Ad-ID schema for expressing metadata specific to ads. An Advertisement may be used in place of a Title in the ContentGroup if the corresponding content is indeed an ad.

5.1.8 SignalGroup

A SignalGroup is a collection of SignalPoints and/or SignalRegions. Signals are points or regions, constrained by 2 points of interest, and are essentially identified time indexes related to a video asset.

Signal metadata may contain additional information about how it was acquired from a corresponding in-band signal. Signal point positions within an asset may be based on a fixed time index and/or contain data to support association with an in-band signal.

5.1.9 PlacementOpportunityGroup

A PlacementOpportunityGroup is a collection of PlacementOpportunityPoints and PlacementOpportunityRegions along with an expression of various rules regarding the placement opportunity. The points and regions will typically correspond with Signal points and regions associated with the video content.

5.2 Specification Components

This specification consists of the following elements:

1. This specification document, which is normative except as otherwise noted.
2. The associated XML schema files are listed in the table below and are normative.

Table 1 - Normative Schema Files

Schema File Name	Namespace
MD-SP-AD-I03.xsd	urn:cablelabs:md:xsd:ad:3.0
MD-SP-CONTENT-I03.xsd	urn:cablelabs:md:xsd:content:3.0
MD-SP-CORE-I03.xsd	urn:cablelabs:md:xsd:core:3.0
MD-SP-OFFER-I03.xsd	urn:cablelabs:md:xsd:offer:3.0
MD-SP-PLACEMENTOPPORTUNITY-I03.xsd	urn:cablelabs:md:xsd:placementopportunity:3.0
MD-SP-SIGNALING-I03.xsd	urn:cablelabs:md:xsd:signaling:3.0
MD-SP-TERMS-I03.xsd	urn:cablelabs:md:xsd:terms:3.0
MD-SP-TITLE-I03.xsd	urn:cablelabs:md:xsd:title:3.0

6 XML CONVENTIONS

This document relies heavily on normative XML schemas to complete this 3.0 specification. Several common conventions are employed in the creation of the schemas and definition of the data model.

6.1 Normative XML Schemas

The messages, elements, and attributes that make up this specification are not explicitly defined in this document. The normative XML schemas (located at <http://www.cablelabs.com/namespaces/metadata/xsd/>) comprise the full normative specification.

No messages representing the interfaces defined in the schema are considered conformant unless they are valid according to the schema documents. In the case where the written normative specification and the normative schema document conflict, the XML schema documents shall take precedence. Furthermore, there are additional requirements described in the schema annotations that are not enforceable by schema validation mechanisms. These requirements MUST also be strictly observed.

The inclusion of a normative XML schema document does not require or imply the specific use of the schema nor a requirement that a message be validated.

6.2 XML Namespaces

Each of the schemas included with this specification has a unique namespace. Table 2 lists the namespaces, recommended prefixes, and a description along with the major types defined.

Table 2 - XML Namespace Declarations

Prefix	Namespace	Description
ad	urn:cablelabs:md:xsd:ad:3.0	
content	urn:cablelabs:md:xsd:content:3.0	Provides all of the known content types
core	urn:cablelabs:md:xsd:core:3.0	Provides the base AssetType and AssetRefType
offer	urn:cablelabs:md:xsd:offer:3.0	Provides OfferType, CategoryType and ContentGroupType
placement opportunity	urn:cablelabs:md:xsd:placementopportunity:3.0	
signaling	urn:cablelabs:md:xsd:signaling:3.0	
terms	urn:cablelabs:md:xsd:terms:3.0	Provides TermsType
title	urn:cablelabs:md:xsd:title:3.0	Provides TitleType
xml	http://www.w3.org/XML/1998/namespace	Used for xml:lang attribute
xsd	http://www.w3.org/2001/XMLSchema	XML foundation. See [XML SchemaP1], [XML SchemaP2]
xsi	http://www.w3.org/2001/XMLSchema-instance	

6.3 Unknown/Unrecognized/Unsupported XML Elements and Attributes

Generally, unknown, unrecognized, or unsupported XML elements and attributes contained within Core Metadata messages and elements SHOULD be ignored during message processing. Specifically, these are elements or attributes that the implementation does not understand or expect.

6.4 Element Order

Element order is constrained by the schema and **MUST** be preserved throughout processing of the XML document. In particular, the order of elements affects the end result of the processing. Consequently, an implementation failing to preserve the order may cause incorrect processing results. Subsequently, the process of producing an abstract XML Information Set (InfoSet) from a concrete XML document, e.g., by parsing it, **MUST** always result in the same abstract InfoSet, with the same element order per XML InfoSet (see [XML InfoSet] for additional information). Any intermediary processing may enhance the XML document, but it **MUST NOT** alter the abstract InfoSet element order (i.e., the XML elements comprising the document **MUST** stay in document order).

6.5 XML Encoding

When generating a new XML Document to this specification, a standard encoding **MUST** be properly expressed in the XML declaration. The actual encoding **SHOULD** be “ISO-8859-1” to provide the best compatibility with existing systems. However, the XML Document **MAY** use any well-known encoding, provided targeted downstream components have been properly tested. The following example shows the XML Declaration:

```
<?xml version="1.0" encoding="ISO-8859-1"?>
```

6.6 Language Identification

In document processing, it is often useful to identify the natural or formal language in which the content is written. A special attribute named `xml:lang` **MAY** be inserted in documents to specify the language used in the contents and attribute values of any element in an XML document. See [XML] for the allowed values. Typically, the `xml:lang` attribute is utilized with an `xsd:string` type.

6.7 Deprecated Elements

There are several cases where elements are defined in the schemas that are intended to be deprecated. These elements are provided for easy backward compatibility with [ADI1.1]. In these cases, the element is defined with a required Boolean **deprecated** attribute, which **MUST** always be present and always be set to *true*. The following example illustrates a deprecated element in an instance document:

```
<Provider deprecated="true">CableLabs</Provider>
```

The deprecated attribute is reserved and **MUST NOT** be used for any other purpose in any extension to this specification. Also, it is not necessary and highly discouraged to include the deprecated attribute on an element when the value is false (not deprecated).

6.8 Extensibility

The base asset type defined in the Core namespace includes an `Ext` element, which allows any content (elements or attributes) from any namespace to be included. This makes it easy to extend or customize an asset in a predictable manner while enabling filters or transforms to be applied. Any consumer of XML documents following this specification can safely ignore contents of the `Ext` element unless they otherwise have an agreement with the XML document producer. There is no requirement by this specification that the contents of the `Ext` element be validated, regardless of whether a namespace is provided. The following example illustrates how the `Ext` element is used:

```
<Ext isAwesome="true" meaningOfLife="42">
  <!-- Could refer to a remote namespace -->
  <Color xmlns=https://www.awesome-provider.com/colors/>Red</Color>
  <!-- Could also look like an ADI 1.1 trial use field -->
  <App_Data app="MOD" name="color" value="blue" />
</Ext>
```

Information routinely added to the `Ext` element could provide the groundwork for future permanent additions to this specification. However, new elements or attributes defined by future revisions to this specification will not be placed within the `Ext` element.

6.9 Enumerated Values

Enumerations are defined as XML schema enumerations only in cases where the set of possible values is strongly believed to be fixed. In several cases, enumerations are actually defined as an XML schema pattern, which provides a set of known standard values and allows private extensibility. To extend this type of enumeration, the value MUST be prefixed with the string “private”, indicating that this is a non-standard value and MAY be ignored or handled in a different way. An example of both a standard and non-standard enumerated value is:

```
<Audience>Children</Audience>
```

```
<Audience>private:Toddler</Audience>
```

6.10 Required Elements

There are several elements that are not explicitly required by the XML Schemas, but are nevertheless required to be provided for any conformant document that originated as per this specification. These elements are optional to allow conversion from ADI 1.1 documents, but MUST be provided for all new documents. These cases are annotated appropriately in the XML Schema.

6.11 Qualified Values

There are several cases in the specification where the value of an element requires additional context to define the set of possible values. In these cases, it is required to provide the scheme from which the value is provided. The attributes described in this section are accompanied with a preliminary list of schemes. The value of the attribute is not confined to the list, but it SHOULD be well understood by all parties consuming the XML.

6.11.1 identifierSystem Attribute

- **VOD 1.1** - To preserve compatibility with ADI 1.1 documents, an alternate identifier is provided to deterministically map to the ADI 1.1 ProviderID / AssetID. It MUST be provided in the following format: vod://{ProviderID}/{AssetID} and follow all the rules for Provider ID and Asset ID set forth in [ADI1.1].
- **EIDR** – Identifiers using this system MUST satisfy all of the requirements for the canonical form of an identifier specified at [EIDR].
- **ISAN** - Identifiers using this system MUST satisfy all of the requirements for an identifier specified at [ISAN].
- **Ad-ID** - Identifiers using this system MUST satisfy all of the requirements for an identifier specified at [Ad-ID].
- **ISCI** - Identifiers using this system MUST be recognizable as an Industry Standard Commercial Identifier.
- **ISRC** - Identifiers using this system MUST satisfy all of the requirements for an identifier specified at [ISRC].

6.11.2 ratingSystem Attribute

- **MPAA** - Includes ratings from [MPAA].
- **TV** - Includes ratings from [TV]. See guidelines for this rating system in Appendix I.4.
- **MSO** - Includes ratings specific to the target MSO. There is no predefined set or format for MSO ratings. They SHOULD be customized by the metadata creator to the expectations of the target MSO.

6.12 UriId Asset Identifier

The uriId is a globally unique identifier for an asset and is the concatenation of ProviderId and AssetId as follows:

```
{ProviderId}/{AssetId}
```

The {ProviderId} is a string that is a registered Internet domain name (e.g., contentOnDemand.com or serviceprovider.com) or a sub-domain of a registered Internet domain name (e.g., abc.cp.com or xyz.sp.com) as defined in section 3.5 of [RFC 1034]. There is no required relationship between the {ProviderId} portion of uriId and the Provider_ID [Content1.1] value.

The {AssetId} is equivalent to the path component of a URI as defined in section 3.3 of [RFC 3986]. {AssetId} is assigned by the provider (as identified by the ProviderId) and must be unique within the realm of the provider. There is no required relationship between the {AssetId} portion on a uriId and the Asset_ID [Content1.1] value.

Note that the uriId pattern used in the informative examples in Appendix I and in the [ADI1.1] XSL transforms follows a restricted form of the uriId pattern as follows:

```
{Provider_ID}/{AssetDiscriminator}/{Asset_ID}
```

For this restricted form, the {ProviderId} portion of the uriId corresponds to the Provider_ID [Content1.1] value, and the {AssetId} portion of the uriId corresponds to the concatenation of the {AssetDiscriminator} (a literal value determined by the type of Asset, e.g., “Offer”), a literal “/”, and the Asset_ID [Content1.1] value. This specific form is recommended when backward-compatibility with [ADI1.1] is required.

6.13 ProviderId Bucket Identifier

The ProviderId is a globally unique identifier for a Bucket, which is a logical container for assets. Each Bucket is associated with a {ProviderId}, and all Assets are managed within the Bucket indicated by the {ProviderId} portion of the Asset UriId. Buckets are created, updated, listed, retrieved and deleted separately from Assets. Bucket metadata.

The {ProviderId} is a string that is a registered Internet domain name (e.g., contentOnDemand.com or serviceprovider.com) or a sub-domain of a registered Internet domain name (e.g., abc.cp.com or xyz.sp.com) as defined in section 3.5 of [RFC 1034]. There is no required relationship between the {ProviderId} portion of uriId and the Provider_ID [Content1.1] value.

7 RELATION TO VOD 1.1

CableLabs previously defined the VOD 1.1 metadata specification ([Content1.1], [ADI1.1]) that has been used worldwide to support the distribution of Video-On-Demand content. This 3.0 specification is intended to replace that specification, and provide for more functionality and flexibility. This new flexibility will support the addition of new on-demand products beyond Video-On-Demand, additional capabilities to existing on demand services - such as advertising - and the addition of additional namespaces that may be required for advanced features.

Metadata 3.0 was designed to be able to support lossless translations of VOD 1.1 packages into Metadata 3.0 Offers. It will also support predictable translation of Metadata 3.0 offers into VOD 1.1 packages for backward compatibility. In that way, the industry will be able to use systems supporting both the old and new standards going forward.

Metadata 3.0 assets break up VOD 1.1 assets into assets that have more focused functions than previously. The Metadata 3.0 assets correspond to VOD 1.1 assets roughly as follows:

Table 3 - Comparison of Metadata 3.0, VOD1.1 Assets

Metadata 3.0 Assets	ADI/VOD 1.1 Assets	Comments
ADI3	Package	This is a group of delivery elements.
Offer	Package	This is what is needed to present a Title and associated content for sale to a customer using a specified set of Terms.
ContentGroup	Package	This is a grouping of Title and associated content.
Title	Title	Only the “facts” about a movie (actor, title, etc.).
Terms	Title	Business requirements for use of the Offer.
Content Types (Movie, Preview, etc.)	Content	Actual content file locations.

XSL Transforms are provided along with this specification as a reference for converting 1.1 to 3.0 and vice versa. The individual mappings of standard values expressed in the XSL Transforms should be considered normative, while some aspects (e.g., ordering of 1.1 elements, handling of trial use fields, etc.) could be altered to fit a particular implementation. The XSL Transform could also be configured to normalize existing inconsistencies in 1.1 metadata that do not meet the specification.

7.1 Converting ADI 1.1 to 3.0

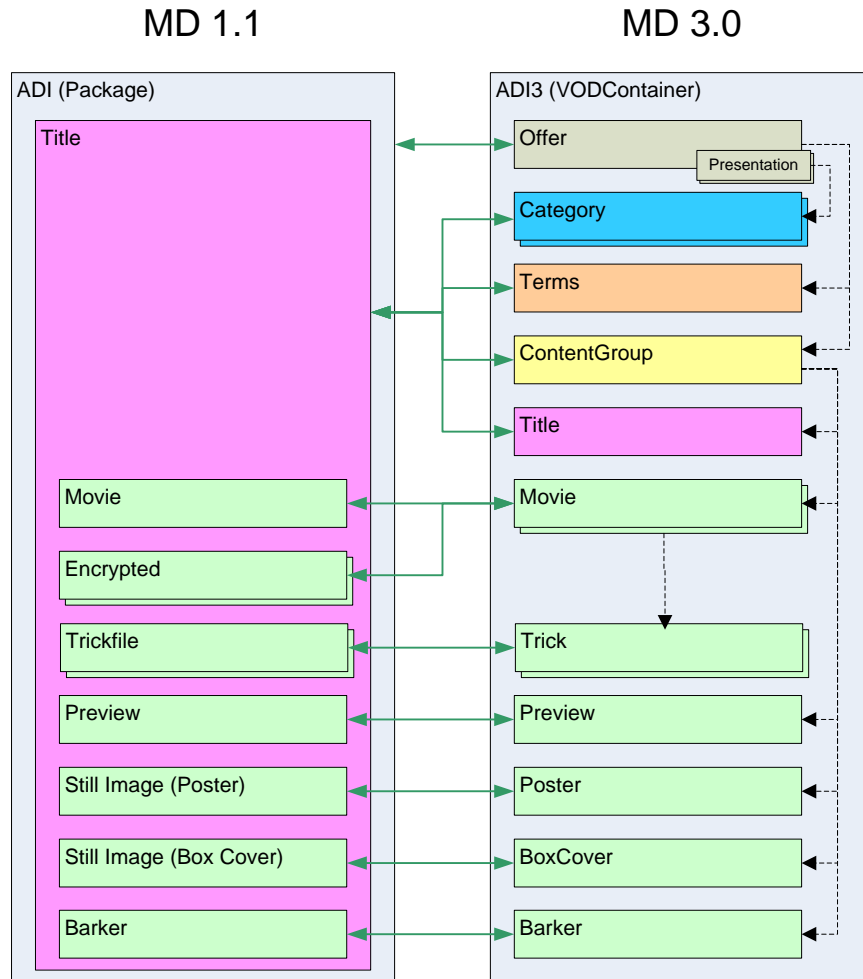

Figure 2 - High level 1.1 ↔ 3.0 Mapping

A major design goal of this specification is to allow ADI 1.1 messages to be deterministically converted to version 3.0 without loss of information. This is considered essential to industry adoption and smooth migration to this 3.0 specification. There are some constraints, however, that **MUST** be observed when considering an ADI 1.1 message for conversion.

- The message **MUST** adhere to [ADI1.1], including the overall structure, inclusion of required fields, adherence to specified formats, and maximum string lengths.
- The AMS elements **SHOULD NOT** include the Verb attribute with a value of DELETE. There is no equivalent message in this specification to communicate this directive. Assets with a Verb attribute of “DELETE” **SHOULD** be ignored when translating to version 3.0.
- Packages that have an “SVOD” app type **SHOULD** also have “SVOD” in the Product attribute of the package’s AMS element to preserve this value in version 3.0.

Additional artifacts of conversion:

- App Data values named “Type” are ignored when they conflict with the Asset_Class.

- DateTime values that do not include a time component are modified after translation to include the time. End date values, such as Licensing_Window_End, are assumed to be the last moment of the day (23:59:59), while most other values are assumed to be the beginning of the day (00:00:00). Converting from 1.1 to 3.0 and back to 1.1 may not preserve the exact string value in the original datetime.
- The order of elements and attributes are not preserved through conversion to 3.0 and back to ADI 1.1.
- The ADI 1.1 title asset is mapped to several 3.0 asset elements (see Figure 2) - including Title, Offer, ContentGroup, Terms and Category.
- The ADI 1.1 encrypted asset is mapped to a 3.0 Movie asset with an EncryptionInfo element.
- All ADI 1.1 trial-use fields (that is, fields not indicated in the specification for that asset type) are mapped to the Ext element of the corresponding 3.0 asset.
- The Licensing_Window_Start and Licensing_Window_End App Data values map to the startDateTime and endDateTime attributes respectively of every 3.0 asset.
- The EIDR App Data value maps to an AlternateId element with an identifierSystem of “EIDR”.
- The ISAN App Data value maps to an AlternateId element with an identifierSystem of “ISAN”.
- The values for ProviderId and AssetId under AMS maps to an AlternateId element with an identifierSystem of “VOD1.1” and a format of vod://{ProviderId}/{AssetId}. This deterministic mapping ensures that these values can be recovered when converting back from 3.0 to 1.1.

7.2 Converting MD 3.0 to ADI 1.1

The full set of features available in this specification cannot be represented using ADI 1.1. However, observing the following constraints will allow the message to be successfully converted.

- The ADI3 container **MUST** contain exactly one Offer element. There is no support in ADI 1.1 for representing multiple offers in a single message.
- The Offer **MUST** reference one Terms, exactly one ContentGroup, and one or more Categories. The referenced elements **MUST** be present in the same message as the Offer. There are no constraints on the PromotionalContentGroup, but it is ignored when converting to ADI 1.1.
- The ContentGroup referenced by the Offer **MUST** reference a Title that is present in the same message. The ContentGroup **MUST** also reference at least one content type that is present in the same message. The content types may be a Movie, Preview, Barker, BoxCover, or Poster. Other content types will be ignored.
- Multiple Presentation elements within the Offer **MUST** have identical values for the DisplayAsNew and DisplayAsLastChance elements.
- There **MUST** be one LocalizableTitle element and it **MUST** be in English (xml:lang=”en”). ADI 1.1 does not provide support for multiple languages.
- All asset types **MUST** contain an AlternateId with an identifierSystem of “VOD1.1”, and the value **MUST** be in the format of vod://{ProviderId}/{AssetId} with ProviderId being no more than 19 characters and AssetId following the ADI 1.1 rule of four alpha characters followed by 16 numeric digits.

Appendix I Examples (informative)

I.1 VOD Movie

The following example includes a VOD movie along with associated preview, box cover and encrypted assets.

I.4 TV Ratings

TV Ratings are composed of an Audience and one or more optional Content Labels. There are 44 possible combinations of the Audience and Content Labels (see Table 4). If Content Labels are used, there MUST be a space as a delimiter between the Audience and the first Content Label; additional Content Labels MUST be delimited by either a comma, or a comma and a space. Additional information on TV Ratings can be found at <http://www.tvguidelines.org>.

Table 4 - Valid TV Rating and Content Label Combinations

TV-Y	TV-Y7	TV-G	TV-PG	TV-14	TV-MA
TV-Y	TV-Y7	TV-G	TV-PG D, L, S, V	TV-14 D, L, S, V	TV-MA L, S, V
	TV-Y7-FV		TV-PG D, L, S	TV-14 D, L, S	TV-MA L, S
			TV-PG D, L, V	TV-14 D, L, V	TV-MA L, V
			TV-PG D, S, V	TV-14 D, S, V	TV-MA S, V
			TV-PG L, S, V	TV-14 L, S, V	TV-MA L
			TV-PG D, L	TV-14 D, L	TV-MA S
			TV-PG D, S	TV-14 D, S	TV-MA V

TV-Y	TV-Y7	TV-G	TV-PG	TV-14	TV-MA
			TV-PG D, V	TV-14 D, V	TV-MA
			TV-PG L, S	TV-14 L, S	
			TV-PG L, V	TV-14 L, V	
			TV-PG S, V	TV-14 S, V	
			TV-PG D	TV-14 D	
			TV-PG L	TV-14 L	
			TV-PG S	TV-14 S	
			TV-PG V	TV-14 V	
			TV-PG	TV-14	

Appendix II Revision History

The following ECNs were incorporated into version I02 of this specification:

ECN	Date Accepted	Title
CONTENTv3.0-N-10.0074-1	12/10/2010	Corrections to Checksum values in examples
CONTENTv3.0-N-10.0075-1	12/10/2010	Clarify values for TV ratings
CONTENTv3.0-N-11.0077-2	4/20/2011	Additions to support AMI
CONTENTv3.0-N-11.0078-1	8/22/2011	Move ADI container element to CORE schema and deprecate the VODContainer schema
CONTENTv3.0-N-11.0079-1	8/22/2011	New Advertising Metadata Schema
CONTENTv3.0-N-11.0080-1	11/8/2011	New Signaling Metadata Schema
CONTENTv3.0-N-11.0082-2	11/8/2011	Additions to support AMI Bucket
CONTENTv3.0-N-11.0083-4	11/8/2011	Collection of minor corrections/additions to I01a
CONTENTv3.0-N-11.0084-1	11/8/2011	CONTENT corrections and additions
CONTENTv3.0-N-11.0086-4	3/9/2012	New Placement Opportunity Metadata Schema
CONTENTv3.0-N-11.0088-1	3/8/2012	Addition of LinearBroadcastDate
CONTENTv3.0-N-11.0089-2	4/30/2012	Add Acquired Signals to signal metadata
CONTENTv3.0-N-12.0090-4	12/7/2012	Miscellaneous cleanup schema changes for pending I02 release

The following ECNs were incorporated into version C01 of this specification:

ECN	Date Accepted	Title	Author
CONTENTv3.0-N-13.0091-1	5/21/2013	Support for A/52 bit stream mode values	Michel
CONTENTv3.0-N-13.0092-2	10/28/2013	All elements directly under all types which extend AssetType optional as well some additional required attributes/elements to optional.	Hood
CONTENTv3.0-N-14.0094-5	1/21/2015	Updates to Core, Offer, PO, Terms, Title and Signal Metadata For Advertising	Michel
CONTENTv3.0-N-15.0095-2	11/3/2015	Support for HEVC codec and UHD resolution; update SCTE-35 namespace	Michel
